Smart Funeral Claims Platform

Purpose of the project

The Smart Funeral Claims Platform is a web-based application designed to improve and automate the funeral insurance claims process. Traditional funeral claims often involve paper forms, manual processing, long waiting periods, and the risk of lost or incomplete documents. This system provides a digital solution where users can register, log in, submit funeral claims, upload supporting documents, and track the progress of their claims online.

The platform also includes an administrator dashboard that enables administrators to review submitted claims, manage users, update claim statuses, and monitor the overall claims process. By digitizing the process, the system improves efficiency, reduces paperwork, enhances data security, and provides a better user experience for both clients and administrators.

Objectives

1. Develop a secure online funeral claims system.
2. Allow users to register and log in securely.
3. Enable digital claim submission and document uploads.
4. Allow users to track the status of their claims.
5. Provide administrators with a dashboard to manage claims and users.
6. Improve the speed, accuracy, and transparency of funeral insurance claim processing.

Implementation language

The Smart Funeral Claims Platform was developed using the following technologies:

Frontend

1. HTML5
2. CSS3
3. JavaScript

Backend

1. Node.js
2. Express.js

Database and Cloud Services

1. Firebase Authentication
2. Firebase Firestore
3. Firebase Storage

Additional Technologies

1. Multer (File Uploads)
2. Nodemailer / EmailJS (Email Notifications)
3. dotenv (Environment Variables)

SDLC Model

Agile Software Development Life Cycle (Agile)

The Agile SDLC model was selected because it supports iterative development, continuous testing, and frequent improvements throughout the project.

The project was developed in small phases, allowing features such as user authentication, claim submission, document uploads, and the administrator dashboard to be implemented and tested independently before integrating them into the final system.

Agile Phases

1. Planning

- Identify project requirements.
- Define system objectives.
- Gather user requirements.

2. Design

- Design the user interface.
- Create system architecture.
- Develop database structure and UML diagrams.

3. Development

- Build the frontend using HTML, CSS, and JavaScript.

- Develop the backend using Node.js and Express.
- Integrate Firebase services.

4. Testing

- Test registration and login.
- Test claim submission.
- Test document uploads.
- Test administrator functions.
- Fix identified errors.

5. Deployment

- Deploy the completed system.
- Configure Firebase.
- Launch the application for users.

6. Maintenance

- Fix bugs.
- Improve system performance.
- Add new features based on user feedback.

To conclude The Smart Funeral Claims Platform provides a secure and efficient digital solution for funeral insurance claims management. The system simplifies the claims process by allowing users to submit claims online, upload supporting documents, and monitor claim progress while enabling administrators to manage claims through an integrated dashboard. Using modern web technologies such as Node.js, Express, Firebase, HTML, CSS, and JavaScript ensures the application is scalable, secure, and user-friendly
